

Power Platform Accelerator for a UAE Government Client

Abu Dhabi Investment Office (ADIO) | Delivered via Truelancer | Ajay Kumar — Power BI Developer

THE BUSINESS PROBLEM

ADIO needed a fast, working proof-of-concept to demonstrate how Microsoft's Power Platform could modernize internal project and portfolio tracking — replacing scattered updates and manual status reporting with a single, structured system covering project workload, task distribution, and cross-departmental visibility for strategic initiatives.

THE SOLUTION

I designed and delivered an end-to-end Power Platform accelerator combining a Power BI reporting layer with Power Automate workflow automation, built around ADIO's own project data structure:

- Built a **Power BI Project Management Dashboard** tracking total projects, total tasks, workload by project, and task distribution across departments (Technology & Innovation, Finance & Investment, Strategy & Planning, Risk & Compliance).
- Structured a detailed task-monitoring view covering project names, programs/departments, and task-level status — giving stakeholders drill-down visibility beyond a high-level summary.
- Implemented **Power Automate flows** to support task escalation and status updates, reducing reliance on manual follow-up between teams.
- Applied ADIO's official Navy & Gold brand identity across every report and visual, so the deliverable was presentation-ready for internal stakeholders, not just functionally complete.

Strategic project categories tracked	Core deliverables — BI dashboard + automation flows	Platforms integrated — Power BI & Power Automate	End-to-end accelerator delivered for a government client

TOOLS & TECHNICAL STACK

Power BI Desktop & Service · DAX · Power Query (M) · Power Automate · Dataverse · Data Modeling & Star Schema Design · Brand-Compliant Report Design

MY ROLE & RESPONSIBILITIES

- Owned the project end-to-end as an independent consultant — from initial data structuring through final dashboard delivery and workflow automation.
- Translated ADIO's project-tracking requirements into a working data model and report layout suited to executive and PMO-level review.
- Debugged and corrected automation logic in the Power Automate flows to ensure reliable task escalation behavior.
- Applied client branding guidelines precisely across every visual element for a presentation-ready final deliverable.

OUTCOME

The completed accelerator gave ADIO a working demonstration of how Power BI and Power Automate can unify project visibility across departments — moving from scattered manual updates toward a single, structured, branded reporting system. It stands as proof that a lean Power Platform build can meet the standards expected by a government-level stakeholder group.
